Just as a reminder, there are various phases to this Banner implementation project. For each area of the Student Module, we must go through each of the following phases:

1. Define-what is the data in question and what are the rules to apply that data?
2. Design-how should we set up the rules to enter and process the data?
3. Configure-entering data and building documents, gathering rules and controls
4. Validate-review data migration for accuracy
5. Test-test the system for functionality and errors; make corrections, apply fixes
6. Train-provide end users first opportunity at using the system in a test environment; gather feedback to improve set up
7. Simulate-test system again
8. Go live

The sessions you attend will use these terms. Please refer to the above key to understand those terms.
